Visualising Fair-Test Data

Bar graphs help scientists compare results from different categories

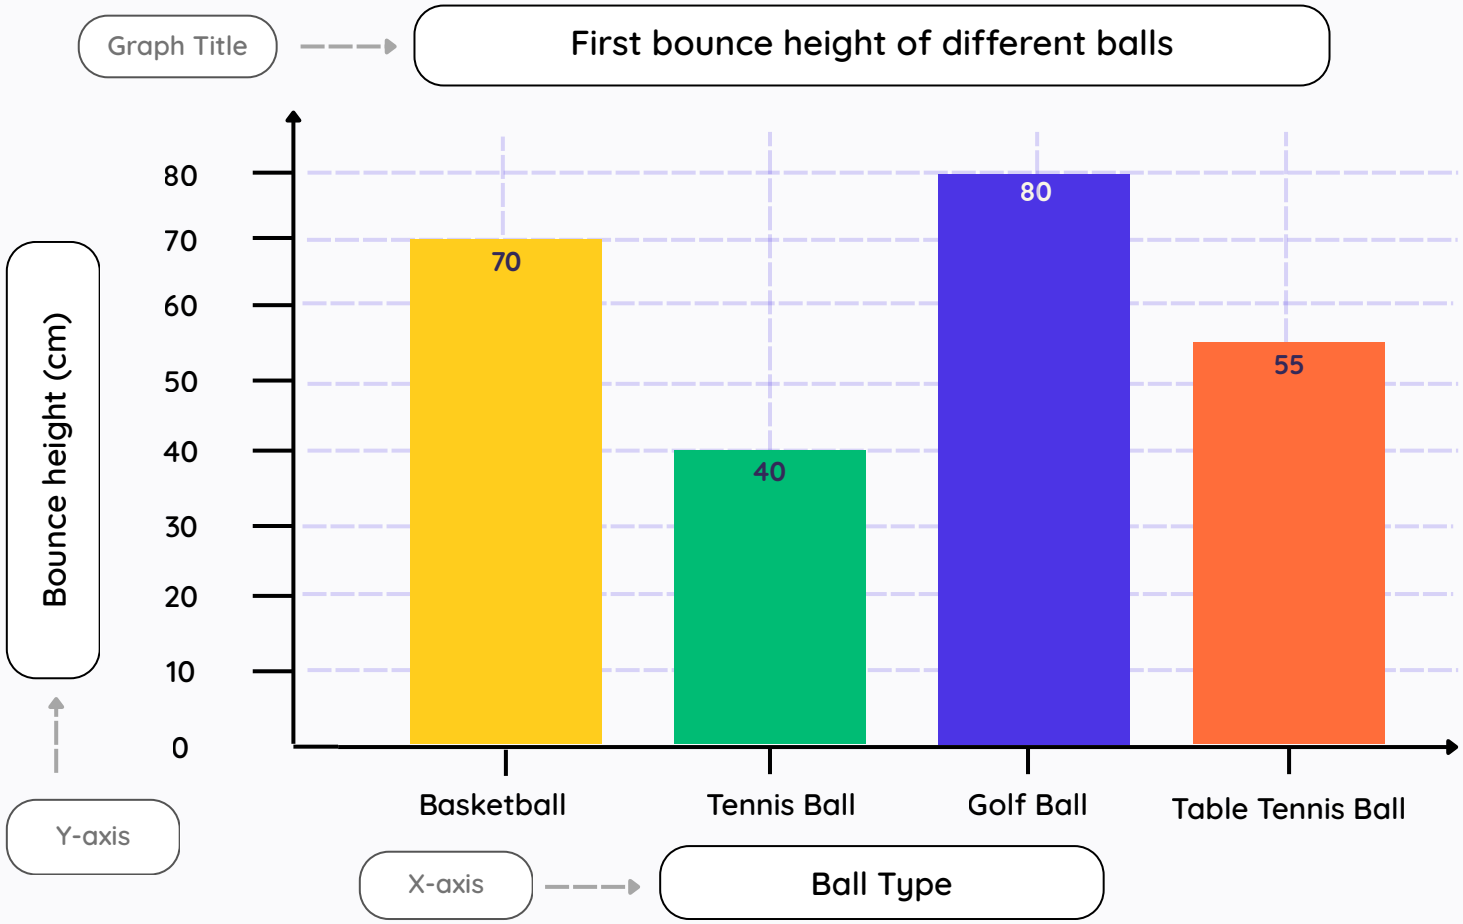

1. Our fair test: Which ball bounces the highest?

Imagine dropping 4 **different balls** from the **same height of 1m** onto the same **wooden floor**. We measure **how high each ball bounces** on its first bounce.

CHANGE	MEASURE	KEEP THE SAME
Independent Variable	Dependent Variable	Controlled Variables
Ball type	Bounce height (cm)	Drop height (1m) Wooden floor

2. Example results

3. What makes a good bar graph?

- ☐ **A clear title**
  Tells us what the fair test is investigating
- ☐ **An x-axis label**
  Tells us the categories or groups being compared
- ☐ **An even scale**
  Starts at zero and increases in equal steps
- ☐ **A y-axis label and units**
  Tells us what was measured or counted
