

# Organising data into a table

Name: \_\_\_\_\_

Draw a line to match the definition to the key words:

Independent Variable

The variables kept the same so the experiment is fair.

Dependent Variable

An experiment where one variable is changed, one is measured, and all others are kept the same.

Controlled Variable

The result that is observed or measured during a fair test.

Fair Test Experiment

The one variable changed during a fair test.

Place the labels into the correct position in the table. Use the word bank to help you.

| Word        | Units       | Dependent Variable | Independent Variable | Bank |
|-------------|-------------|--------------------|----------------------|------|
| Condition 1 | Condition 2 | Condition 3        |                      |      |
| Units       | Test 1      | Test 2             | Test 3               |      |
|             |             |                    |                      |      |
|             |             |                    |                      |      |
|             | DATA        | DATA               | DATA                 |      |
|             | DATA        | DATA               | DATA                 |      |
|             | DATA        | DATA               | DATA                 |      |

## Record Data in a Table and Calculate Averages

Use the space in the table below to record data from the effect of temperature on yeast fair test experiment. Practice calculating the average of a similar experiment below.

To calculate the average = Test 1 + Test 2 + Test 3 divided by 3. Show your working out.

|                  | CIRCUMFERENCE OF BALLOON (CM) |        |        |                                                                  |
|------------------|-------------------------------|--------|--------|------------------------------------------------------------------|
| Temperature (°C) | TEST 1                        | TEST 2 | TEST 3 | AVERAGE                                                          |
| 2                |                               |        |        | $= \frac{\text{Test 1} + \text{Test 2} + \text{Test 3}}{3}$<br>= |
| 22               |                               |        |        |                                                                  |
| 37               |                               |        |        |                                                                  |
| 80               |                               |        |        |                                                                  |

### Reasoned Prediction:

*As the temperature increases, the amount of gas made by yeast increases.  
This is because living things need to be warm to survive.*

**Use the data to describe the results using the tick boxes:**

As the temperature increases from **2°C to 37°C**, the amount of gas made by yeast: ☐ increase ☐ decrease ☐ does not change

At **80°C**, the amount of gas made compared with **37°C**: ☐ increase ☐ decrease ☐ does not change
